Faculty Focus:

Prakash Nagarkatti, Ph.D., has received international recognition for his laboratory’s discovery of a link between cannabis and immunosuppression. His studies reveal that smoking marijuana can trigger a suppression of the body’s immune functions, making cannabis users more susceptible to certain types of cancers and infections. The findings also point to the possibility of using compounds found inside the cannabis plant as a treatment for a large number of additional clinical conditions.

Lucia Pirisi-Creek, MD, is the lead investigator for the state of South Carolina’s $16 million grant for biomedical research in the areas of regenerative medicine, biochemistry, and molecular biology. Funding comes from the National Center for Research Resources, a division of the National Institutes of Health.
